

Roller Oil UNI

New Universal roller protection oil makes life easier in mixed environments.

The days when you had to be careful about which protective lubricant to use on what kind of rollers when running idle, are finally over. Blueprint newly developed **Roller Oil UNI** can be applied on either NBR, Combi and EPDM rollers without the danger of having incompatibility issues, causing damage. You can safely use this universal protective oil in conventional-, mixed and or UV environments.

Roller Oil UNI protects all kind of rubber ink rollers from overheating and “cracking” when printing units are running idle. A minimum quantity applied every 2 to 4 hours directly to the rollers is sufficient to keep them lubricated during the whole run length.

A great advantage is the fact that **Roller Oil UNI** lets itself remove very easily by using your standard automatic wash program or manually by applying your daily wash directly to the rollers. It's offered as a liquid for easy and safe application during printing.

Roller Oil UNI does not affect the ink transfer properties of the rubber surface in any way, a new colour can be applied to the group without any negative effect from the previously used protective oil when it was running idle.

Roller Oil UNI is approved for food packaging applications, and available in 1L spray bottle packaging
